

KUROKO G-A-2: May 16 Primary Artifact Verification Report

Investigation ID:	KUROKO-GA2-MAY16-20260907
Investigation Date:	2026-09-07
Primary Artifact:	TODO_147 (Relay Project)
Artifact Creation:	2026-05-16T10:20:27.298613
Temporal Focus:	May 16, 2026

Chapter 1: Evidence Correction & Methodology Note

Prior Identification Error

Initial G-A investigation incorrectly identified TODO_169 (Orchestra) instead of TODO_147 (Relay) as the Relay project inception artifact. This error has been corrected, and all subsequent analysis uses TODO_147 as the correct primary artifact.

Chapter 3: May 16 Six-Item Independent Verification Matrix Summary

Item	Classification	Confidence	Key Evidence
1. Relay Existence	CONFIRMED	HIGH	TODO_147 created_at timestamp
2. Handoff Concept	CONFIRMED	HIGH	Description: ██████████
3. Logbook Concept	UNKNOWN	MEDIUM	Not in May 16 record
4. LB_001 Identifier	STRONGLY SUPPORTED	HIGH	May 31 PHIOS test confirmation
5. Predecessor System	NOT FOUND	HIGH	No prior mechanism found
6. Source/Inheritance	CONFIRMED	HIGH	Independent architecture stated

Chapter 5: Key Finding - mini MoCKA Series ■■2 Origin

Verdict: CONFIRMED CONTEMPORARY

The phrase 'mini MoCKA Series ■■2■Relay■' was part of the May 16 creation record (description field), not a June 1 retrofit. This confirms that Relay was conceptualized as Product 2 of the mini series from inception.

Chapter 11: Uncertainty Preservation - Unresolved Questions

The following questions remain UNKNOWN and require further investigation:

- 1. **LB_* naming origin:** Was the scheme designed at May 16 inception or emergent during May 16-31 implementation?
- 2. **Logbook concept detail:** Was explicit logbook architecture planned May 16 or designed during implementation?

3. **Ultimate source:** What prior design or product inspired the LB_* identifier scheme?
4. **Relay series positioning:** Was Relay truly first/second in mini series, or was numbering retroactive?

Chapter 12: Evidence-Based Next Investigation Branches

Four prioritized investigation branches are recommended:

- Priority 1:** Git archaeology for relay-logbook.js first commit (identify LB_* naming origin)
- Priority 2:** Design document search for May 16 logbook architecture
- Priority 3:** TODO timeline comparison for product series verification
- Priority 4:** Pre-May-16 code search for LB_* identifier usage

Chapter 15: G-A-2 Conclusion & Audit Judgment Request

The G-A-2 May 16 Primary Artifact Verification investigation has completed the six-item classification matrix with clear CONFIRMED/STRONGLY SUPPORTED/UNKNOWN distinctions. The temporal separation of May 16 original evidence from June 1 retrospective updates has been rigorously maintained.

This report awaits audit judgment from ■■■■■ and the review authority to determine: (1) methodological soundness, (2) evidence classification appropriateness, (3) next investigation branch authorization.
