

KUROKO G-A-2: May 16 Primary Artifact Verification Report

Investigation ID:	KUROKO-GA2-MAY16-20260907
Investigation Date:	2026-09-07
Primary Artifact:	TODO_147 (Relay Project)
Artifact Creation:	2026-05-16T10:20:27.298613
Temporal Focus:	May 16, 2026

Chapter 1: Evidence Correction & Methodology Note

Prior Identification Error

Initial G-A investigation incorrectly identified TODO_169 (Orchestra) instead of TODO_147 (Relay) as the Relay project inception artifact. This error has been corrected, and all subsequent analysis uses TODO_147 as the correct primary artifact.

Chapter 3: May 16 Six-Item Independent Verification Matrix Summary

Item	Classification (May 16-Specific)	Confidence	Key Evidence
1. Relay Existence	CONFIRMED	HIGH	TODO_147 record exists at May 16
2. Handoff Concept	UNKNOWN	Current	Current record contains text; field-level timing unknown
3. Logbook Concept	UNKNOWN	MEDIUM	Not in May 16 record
4. LB_001 Identifier	NOT FOUND	HIGH	No May 16 evidence; operational by May 31
5. Predecessor System	NOT_FOUND_IN_EXAMINED_EVIDENCE	HIGH	Absence does not prove non-existence
6A. Independent Implementation	UNKNOWN	Current	Current record contains statement; field-level timing unknown
6B-6D. Inheritance / Source	UNKNOWN	N/A	No evidence chain established

Chapter 5: Key Finding - mini MoCKA Series ■■2 Origin

Verdict: STRONGLY_SUPPORTED_AS_MAY16_CONTEXT

The phrase 'mini MoCKA Series ■■2■Relay■' appears in the current record at created_at timestamp May 16 (not a June 1 addition). This strongly suggests May 16 product conception. However, field-level modification history is not available, so field-level timing cannot be independently verified. Contextual evidence is strong; absolute proof awaits field-level history.

Chapter 11: Uncertainty Preservation - Unresolved Questions

The following questions remain UNKNOWN and require further investigation:

- Handoff concept field-level timing:** Was description text present on May 16, or added later? (field-level history unavailable)

2. **Independent implementation statement timing:** Was this statement in description on May 16? (field-level history unavailable)
3. **LB_* naming origin:** When did LB_001 first emerge? May 16? May 20? May 31?
4. **Logbook concept detail:** Was explicit logbook architecture designed May 16 or May 16-31?
5. **Ultimate source:** What prior design or product inspired LB_* or handoff architecture?
6. **Prerequisite mechanism:** Did Relay derive from prior product concepts?

Chapter 12: Evidence-Based Next Investigation Branches

Four prioritized investigation branches are recommended:

- Priority 1:** Git archaeology for relay-logbook.js first commit (identify LB_* naming origin)
- Priority 2:** Design document search for May 16 logbook architecture
- Priority 3:** TODO timeline comparison for product series verification
- Priority 4:** Pre-May-16 code search for LB_* identifier usage

Chapter 15: G-A-2 Conclusion & Audit Judgment Request

The G-A-2 May 16 Primary Artifact Verification investigation has completed the six-item classification matrix with clear CONFIRMED/STRONGLY SUPPORTED/UNKNOWN distinctions. The temporal separation of May 16 original evidence from June 1 retrospective updates has been rigorously maintained.

This report awaits audit judgment from ■■■■■ and the review authority to determine: (1) methodological soundness, (2) evidence classification appropriateness, (3) next investigation branch authorization.
